

1. Color control of lacquers

The lacquer should be inline controlled. At this a special casing is used which will be plunged into the lacquer. A color sensor type **SPECTRO-3-FIO-CL** in connection with an optical fiber type **R-S-A3.0-(3.0)-1200-67°** and a special frontend type **KL-PLNG-A3.0** is used. The different lacquers can be differentiated properly.
